

Web Refund Flow

Trigger path from dashboard interaction to server orchestration, Shopify context loading, refund evaluation, and UI render.

Module / Input / Output Map

This page lists each module boundary so you can follow data movement more easily.

Web Layer

- dashboard.tsx: client interactions, URL updates, pending state
- page.tsx: server orchestration for loadOrders + checkRefundEligibility
- dashboard-helpers.ts: parse URL state, filter orders, select active order
- orders-panel.tsx + order-details-panel.tsx: render queue and selected order details

Core Application

- check-refund-eligibility.ts input: { orderId }, config
- checkRefundEligibility output: CheckRefundEligibilityResult
- Result includes decision, reasons, evidence, recommendedNextAction
- Promise.allSettled wraps one refund-check promise per loaded order

Shopify / Domain

- load-orders.ts input: { limit }, env, optional fetchImpl
- load-orders.ts output: ShopifyOrderSummary[]
- load-refund-context.ts input: orderId, env, optional fetchImpl
- load-refund-context.ts output: RefundPolicyInput -> evaluateRefundPolicy -> RefundPolicyResult

Request / Response Sequence

- 1. User changes search, filter, or selected order in the browser.
- 2. dashboard.tsx builds a new query string and calls router.replace(nextUrl).
- 3. Next.js re-runs Home({ searchParams }) on the server for that URL.
- 4. page.tsx loads recent orders, then runs checkRefundEligibility once per loaded order.
- 5. Each successful CheckRefundEligibilityResult is mapped onto a DashboardOrder row.
- 6. page.tsx filters rows using the parsed URL state and selects the active order.
- 7. Dashboard receives props and React updates the OrdersPanel and OrderDetailsPanel.
- 8. If order loading fails, ordersLoadError is shown. If one row evaluation fails, the selected order gets a specific details-panel error.

Key Trigger

Client URL change -> server page re-render -> live order evaluation -> dashboard repaint

Key Outputs

DashboardOrder[], selected order, evidence cards, timeline, decision pill, and error banners
